Hyperoxia late-phase convergence (S021 reruns, FiO2 = 1.0, S1 healthy)
3 drift-converged runs run off-scale
to ≈1,400 mmHg (numerical runaway; excluded from median)
S1 median trajectory (38 physiological-converged of 41 converged)
600 mmHg locked classifier upper bound
≈ 663 mmHg alveolar-gas-equation prediction (alveolar PAO2)
Arterial PaO2 (mmHg)
Extended-simulation time t′ (s); t′ = 0 corresponds to t = 120 s of the original simulation
