
7 operational inputs
HR, SBP, DBP, RR, Vt, FiO2, PEEP
Morris sampling:
20 trajectories × 8 = 160 runs/cell
8 cells = 4 severity scenarios × 2 sexes
severity (impairment fraction): Healthy 0.00,
Mild 0.26, Moderate 0.60, Severe 0.95
× 2 sexes (male, female) ⇒ 8 × 160 = 1,280 simulations
steady-state means
6 steady-state outputs
HR, MAP, Vt delivered, SpO2, PaO2, PaCO2
classify every run
Four-flag steady-state classifier
clamped, diverged, implausible, not_steady_state
Morris μ* and σ
per input, output and
cell, from clean pairs
Per-cell traffic-
light curation and
review-priority map
